

# CrystalTone

Are you finding it hard to understand what people are saying on the telephone? Do you find yourself asking people to speak up or slow down? It's not unusual for people with hearing loss to hesitate to make a call because of feelings of embarrassment or even fear of misunderstanding. There are many different amplified phones available today to help in most of these situations.

One example is Ultratec's CrystalTone amplified phone. It increases the volume up to 35dB and can also enhance the sound quality of both the high and low frequency ranges for clearer reception. Its features include:

- Extremely powerful amplifier (up to 35dB)
- Crystal Tone (A/B) switch lets users adjust for high, low or combination of frequency ranges to the level they hear best
- Hearing Aid compatible handset
- Audio jack (3.5mm) for use with some assistive listening devices
- Dial pad is large and easy to read
- 10 Memory buttons plus 3 Emergency speed-dial keys
- Outgoing volume button lets you increase the volume of your outgoing voice for the benefit of the person on the other end (up to 12dB)
- Ring flasher alerts you visually to incoming calls
- Loud ringer (up to 100dB) with adjustable ring pitch
- Tone control amplifies and enhances the incoming voice
- Volume automatically resets after the phone is hung up, allowing others to enjoy conversations without amplification. Press the Volume button to quickly restore the volume and tone to your preferred settings.
